ABSTRACT:

Pharmaceuticals permeable to the blood-brain barrier contain long-chain unsatd. fatty acids such as 4,7,10,13,16-docosapentaenoic acid (I), and pharmaceuticals such as hypnotics, antiepileptics, antipyretics, etc. Thus, I 60, phosphatidylcholine 2, and H₂O 38 parts by wt. were mixed with diazepam-N-methyl-3H, and homogenized in an ultrasonic oscillator to give a uniform dispersion. The radioactivity of diazepam was 20 .mu.Ci/mL. This soln. was i.v. injected at 0.5 mL into the rat, which was sacrificed 5 min later to exam. the radioactivity in the brain. The concn. of diazepam in the brain was 3 times that of control injected with a formulation contg. no I.
